RELEASE NOTES V1.1.3

MISSION CONTROL V1.1.3

ISSUE/FEATURE	
Long startup time while the LCD is black	A long startup time (around 30 seconds) was observed, specifically when the LCD remains black. It appears related to an MCU bug and previous findings regarding PHY initialization. The amp eventually boots to the usual operation mode, not failsafe. This boot issue has been resolved.
Amps can crash and reboot into failsafe by a network loop	Network task did starve other tasks when packets were flooding the receiver (e.g. when a loop was present at a switch) causing a reboot into failsafe mode. This issue is resolved.
"Auto dark UI" option added to LCD menu	A timer set to 60 seconds, dark after timeout, restart on user interaction and on startup, bright on start or restart was implemented.
Speaker preset lib display in LCD gets mixed up after uploading speaker presets	Adding new speaker presets invalidates the memory pointers, thus requiring an update of widget data. An update method was implemented resolving this issue.
CusCons are limited to 32 channels	The new limit for channels is now set to 250.
